

bitcoin

a digital currency

what is bitcoin?

Bitcoin is an entirely new digital money system. It is built on time-tested Internet technologies and mathematical functions, such as, peer-to-peer networking and advanced cryptography.

why should i care?

There is no central authority that issues or controls Bitcoin. Because it is not controlled by any world government, corporation, or organization, it has the potential to advance human freedom and global trade more than any other technology invented by man.

how does it work?

Bitcoin is a free, open-source application for Mac/Windows/Linux computers and web-enabled smartphones. The software allows pseudo-anonymous "coins" to be transferred irreversibly between individuals or merchants via a peer-to-peer network across the Internet. No usage or transaction fees are required and Bitcoins can also be traded on open exchanges for value against other fiat currencies and commodities. Bitcoin is the world's first deflationary currency. Unlike gold, there is a mathematically limited number of Bitcoins that will ever exist. It is inevitable that some will be lost to attrition meaning that the supply can only go down*. Unlike any other currency, it can be securely stored on a thumb drive, transferred across any geographical or political boundary, without interruption. If you understand the implications this could have towards technical innovations, global free trade, and human rights and would like to learn more, visit <http://BitcoinIntro.com>.

Unlock some hidden treasure!

Bitcoin Key:

Visit <http://BitcoinIntro.com/hidden-treasure/> to learn how to retrieve your first Bitcoins locked away with this key. But you must be fast or someone might wisk them away from you before you get a chance to move them to your own private Bitcoin wallet!
